

**SUBSTITUTED 4-PHENYL-[1,3]-DIOXANES****Field of the Invention**

This invention relates to a series of urea-containing substituted 4-phenyl-[1,3]-dioxanes, pharmaceutical compositions containing these compounds, and intermediates used in their manufacture, and methods of using them.

**Background of the Invention**

In the central nervous system neurons expressing prepro-orexin, the precursor from which orexin is produced, are found in the perifornical nucleus, the dorsal hypothalamus and the lateral hypothalamus (C. Peyron et al., *J. Neurosci.*, **1998**, 18(23): 9996-10015). Orexinergic cells in these nuclei project to many areas of the brain, extending rostrally to the olfactory bulbs and caudally to the spinal chord (A.N. van den Pol, *J. Neurosci.*, **1999**, 19(8): 3171-3182). The orexins bind to two high affinity receptors, termed Orexin-1 and Orexin-2 receptors. The orexin-1 receptor is selective in favor of orexin A, while the orexin-2 receptor binds both orexins with similar affinities. The broad CNS distribution of orexin projections and neurons expressing orexin receptors is suggestive of orexin involvement in a number of physiological functions such as feeding, drinking, arousal, stress, metabolism and reproduction. A recent paper describing targeted necrosis of cells expressing prepro-orexin suggests the most physiologically important roles of the orexins are likely to be effects on arousal, feeding and metabolism (J. Hara et al., *Neuron*, **2001**, 30:345-354). A prominent orexin neuronal projection via the vagus nerve probably mediates published central orexin effects on cardiac parameters (W.K. Samson et al., *Brain Res.*, **1999**, 831:248-253; T. Shirasaka et al., *Am. J. Physiol.*, **1999**, 277:R1780-R1785; C.-T. Chen et al., *Am. J. Physiol.*, **2000**, 278:R692-R697), gastric acid secretion and gastric motility (A.L. Kirchgessner and M.-T. Liu, *Neuron*, **1999**, 24:941-951; N. Takahashi et al., *Biochem. Biophys. Res. Commun.*, **1999**, 254:623-627).

A number of factors suggest the orexin system is an important modulator of arousal. Orexin given i.c.v. increases the time rodents spend awake (D.C. Piper et al., *Eur. J. Neurosci.*, **2000**, 12:726-730) as measured

using EEG and EMG recordings. Orexin-mediated effects on arousal are linked to orexin neuronal projections to histaminergic neurons in the tuberomammillary nucleus and can be blocked with an H1 antihistamine (A. Yamanaka et al., *Biochem. Biophys. Res. Commun.*, **2002**, 290:1237-1245).

- 5 TMN histaminergic neurons express orexin-2 receptor and less orexin-1 receptor. Rodents whose pre-pro orexin gene has been knocked out (R.M. Chemelli et al., *Cell*, **1999**, 98:437-451) or whose orexigenic neurons have been killed (J. Hara et al.) display altered sleep/wake cycles similar to narcolepsy. The dog models of narcolepsy have been shown to have a mutant  
10 and non-functional orexin-2 receptor (L. Lin et al., *Cell*, **1999**, 98:365-376). Human narcolepsy appears to be linked to deficient orexin signaling, most likely related to immune ablation of orexinergic neurons in the lateral hypothalamus (E. Mignot et al., *Am. J. Hum. Genet.*, **2001**, 68:686-699; E. Mignot and E. Thorsby, *N. Engl. J. Med.*, **2001**, 344(9):692). In rare cases  
15 human narcoleptics have also been identified with mutant orexin-2 receptors (C. Peyron et al., *Nat. Med.*, **2000**, 6(9):991-997).

- Disorders of the sleep-wake cycle are therefore likely targets for orexin-2 receptor antagonist therapy. Examples of such disorders include sleep-wake transition disorders, insomnia, restless legs syndrome, jet-lag and sleep  
20 disorders secondary to neurological disorders (manias, depressions; manic depression, schizophrenia, pain syndromes and the like).

- The orexin system also interacts with brain dopamine systems. Intracerebroventricular injections of orexin increase locomotor activity, grooming and stereotypy; these behavioral effects are reversed by  
25 administration of D2 dopamine receptor antagonists (T. Nakamura et al., *Brain Res.*, **2000**, 873:181-187). Orexin-2 antagonists may therefore be useful to treat neurological disorders such as Parkinson's Disease, Gilles de la Tourette's Syndrome, anxiety, delirium and dementias.

- Effects of the orexins on body weight are likely to be mediated by  
30 orexin-mediated increases in appetite (T. Sakurai et al., *Cell*, **1998**, 92:573-585) and alterations in metabolism (M. Lubkin and A. Stricker-Krongrad, *Biochem. Biophys. Res. Commun.*, **1998**, 253:241-245). Some orexin effects on appetite and metabolism may be mediated in the gut, where orexins alter

gastric acid secretion and gastric motility. Orexin antagonists are therefore likely therapies for obesity and may, through weight loss, be useful to treat consequences of obesity such as insulin resistance/type 2 diabetes, hyperlipidemia, gallstones, angina, high blood pressure, breathlessness, infertility, sleep apnea, back pain, joint pain, varicose veins and osteoarthritis. Conversely, the orexin system appears to be involved in anorectic/bulimic/exercise related amenorrhea and could therefore be useful in fertility control.

Orexins and their receptors have been found in both the myenteric and submucosal plexus of the enteric nervous system (A.L. Kirchgessner and M.-T. Liu). The orexins have been shown to increase motility in vitro (A.L. Kirchgessner and M.-T. Liu) and to stimulate gastric acid secretion in vivo (N. Takahashi et al.). Orexin effects on the gut may be driven by a projection via the vagus nerve (A.N. van den Pol), as vagotomy or atropine prevent the effect of a central (i.c.v) injection of orexin on gastric acid secretion (N. Takahashi et al.). Orexin antagonists are therefore potential treatments for ulcers, irritable bowel syndrome, diarrhea and gastroesophageal reflux.

Intracerebroventricularly administered orexins have been shown to increase mean arterial pressure and heart rate in freely moving (awake) animals (W.K. Samson et al.; T. Shirasaka et al.) and in urethane anaesthetized animals (C.-T. Chen et al.), with similar results. Orexin antagonists are therefore candidates for treatment of hypertension, angina pectoris, arrhythmias and acute heart failure.

15 “Therapeutically effective amount” or “effective amount” means that amount of active compound or pharmaceutical agent that elicits the biological or medicinal response in a tissue system, animal or human that is being sought by a researcher, veterinarian, medical doctor or other clinician, which includes alleviation of the symptoms of the disease or disorder being treated.

20 Concerning the various radicals in this disclosure and in the claims, three general remarks are made. The first remark concerns valency. As with all hydrocarbon radicals, whether saturated, unsaturated or aromatic, and whether or not cyclic, straight chain, or branched, and also similarly with all heterocyclic radicals, each radical includes substituted radicals of that type and  
25 monovalent, bivalent, and multivalent radicals as indicated by the context of the claims. The context will indicate that the substituent is an alkylene or hydrocarbon radical with at least two hydrogen atoms removed (bivalent) or more hydrogen atoms removed (multivalent). An example of a bivalent radical linking two parts of the molecule is X in formula (I) that links a substituted  
30 phenyl.

Second, radicals or structure fragments as defined herein are understood to include substituted radicals or structure fragments. Hydrocarbyls include monovalent radicals containing carbon and hydrogen

such as alkyl, alkenyl, alkynyl, cycloalkyl, and cycloalkenyl (whether aromatic or unsaturated), as well as corresponding divalent radicals such as alkylene, alkenylene, phenylene, and so on. Heterocarbyls include monovalent and divalent radicals containing carbon, hydrogen, and at least one heteroatom.

5 Examples of monovalent heterocarbyls include acyl, acyloxy, alkoxyacyl, heterocyclyl, heteroaryl, aroyl, benzoyl, dialkylamino, hydroxyalkyl, and so on. Using "alkyl" as an example, "alkyl" should be understood to include substituted alkyl having one or more substitutions, such as between 1 and 5, 1 and 3, or 2 and 4 substituents. The substituents may be the same (dihydroxy, dimethyl),  
10 similar (chlorofluoro), or different (chlorobenzyl- or aminomethyl-substituted). Examples of substituted alkyl include haloalkyl (such as fluoromethyl, chloromethyl, difluoromethyl, perchloromethyl, 2-bromoethyl, perfluoromethyl, and 3-iodocyclopentyl), hydroxyalkyl (such as hydroxymethyl, hydroxyethyl, 2-hydroxypropyl, aminoalkyl (such as aminomethyl, 2-aminoethyl, 3-aminopropyl,  
15 and 2-aminopropyl), nitroalkyl, alkylalkyl, and so on. A di(C<sub>1-6</sub> alkyl)amino group includes independently selected alkyl groups, to form, for example, methylpropylamino and isopropylmethylamino, in addition dialkylamino groups having two of the same alkyl group such as dimethyl amino or diethylamino.

20 Third, only stable compounds are intended. For example, where there is an NR'R" group, and R can be an alkenyl group, the double bond is at least one carbon removed from the nitrogen to avoid enamine formation. ## C. Synthesis

The compounds of the present invention may be prepared by conventional synthetic organic chemistry and by matrix or combinatorial methods according to Schemes 1 through 6 and Examples 1 through 46 below. Those of ordinary skill in the art will be able to modify and adapt the guidance provided herein to make the disclosed compounds.

The invention provides methods of making the disclosed compounds according to traditional organic synthetic methods as well as parallel, matrix, or combinatorial synthetic methods. Schemes 1 through 6 describe suggested synthetic routes. Using these Schemes, the guidelines below including the I.C. Nordin and J.A. Thomas reference (*Tetrahedron Letters*, 1984, 25(50):5723-5724) and the examples in section E, a person of ordinary skill in the art may develop analogous or similar methods for a given compound.

Examples of the described synthetic routes include synthetic Examples 1 through 46. Compounds analogous to the target compounds of these examples can be, and in many cases have been, made according to analogous routes. The disclosed compounds are useful in basic research, in drug screens, in diagnostic assays, and as pharmaceutical agents.

Compounds of formula 1 are prepared according to I.C. Nordin and J.A. Thomas (*Tetrahedron Letters*, 1984, 25(50):5723-5724). Compounds of formula 2, where W is O or S, are prepared according to Scheme 1 by reacting amine 1 with a commercially available isocyanate or isothiocyanate.

Specifically, amine 1 is dissolved in a solvent such as pentane, toluene, dichloromethane or the like and treated with an isocyanate (or isothiocyanate) directly or a solution of isocyanate (or isothiocyanate) in a solvent such as

pentane, toluene, dichloromethane or the like at room temperature.. However, the reaction is typically exothermic, and caution should be used. The Nordin reference describes how to make (4S,5S)-2,2-dimethyl-4-phenyl-1,3-dioxan-5-amine (1) from (1S,2S)-2-amino-1-phenyl-1,3-propanediol. In most Examples  
 5 in this application, "amine 1" is the (4S,5S) stereoisomer. Example 18, where the product is a (4R,5S) urea, is the lone exception. (Some of the other Examples describe the (4S,5S) final product synthesized by a route that does not use amine 1.)

10 Compounds of formula 3, where R<sup>2'</sup> is I or Br, are prepared according to Scheme 1. Compounds of formula 2a are prepared according to Scheme 2 via standard organometallic coupling reactions such as the Suzuki reaction. Relevant references include N. Miyaura and A. Suzuki (*Chem. Rev.* **1995**, 95, 2457) and B. I. Alo et al. (*J. Org. Chem.*, **1991**, 56, 3763). Specifically, a  
 15 compound of formula 3 is reacted in Step B with a palladium(0) source such as tetrakis (triphenylphosphine) palladium(0) in a solvent such as ethylene glycol dimethyl ether. Subsequent addition of the desired boronic acid coupling partner dissolved in a solvent such as ethanol or ethylene glycol dimethyl ether and addition of an aqueous solution of sodium carbonate gives a compound of  
 20 formula 2a via a Suzuki coupling reaction. Suzuki reactions are typically carried out at elevated temperatures, such as 80 °C or the boiling point of the solvent. Various heterocyclic boronic acids such as thiophene boronic acids and pyridine boronic acids may be used in addition to aryl and aryl substituted boronic acids. The Suzuki coupling reaction may also be used to place  
 25 substituents at positions other than R<sup>2</sup>, such as at the *para* position, R<sup>4</sup>, if desired, assuming the starting material chosen for formula 3 possessed a halogen substituent at the *para* position. Substitution at R<sup>2</sup> in Scheme 2 is shown only as one possible example.

Step B can also represent other reactions of a compound of formula 3 and a palladium(0) source such as tetrakis(triphenyl)phosphine palladium (0) in a solvent such as N,N-dimethylacetamide. For example, reaction with zinc cyanide at elevated temperatures such as 80 °C gives a compound of formula 5 2a where R<sup>2</sup> is a cyano group.

Compounds of formula 2a are prepared according to Scheme 3 by reacting a commercially available aniline of formula 4 with a coupling reagent such as 1, 1'-carbonyldiimidazole and amine 1 in Step C. Specifically, a solution of aniline 4 in a solvent such as N,N-dimethylformamide, N,N-dimethylacetamide, dichloromethane or the like is reacted with a coupling reagent such as 1,1'-carbonyldiimidazole or 1,1'-carbonyldiimidazole in the presence of a catalytic amount of 4-(dimethylamino)pyridine. Subsequent addition of amine 1 in a solvent such as N,N-dimethylformamide followed by possible heating to elevated temperatures such as 100 °C or the boiling point of the solvent gives a compound of formula 2a.

Compounds of formula 6 and formula 2a can be prepared according to Scheme 4. Scheme 4 represents an alternative way of making compounds of formula 2a. Specifically in Step D, a commercially available compound of formula 5 is reacted with a commercially available isocyanate in a solvent such as dichloromethane, N,N-dimethylformamide or the like. A catalytic amount of PS-DMAP may be used in some examples to assist the reaction. In Step E, a compound of formula 6 is exposed to standard acetonide forming conditions such as acetone, 2,2-dimethoxypropane, catalytic *p*-toluenesulfonic acid in a co-solvent such as N,N-dimethylformamide. Polymer-bound acids such as MP-TsOH may be used and reactions are typically performed at room temperature.

SCHEME 5

Compounds of formula 7 and formula 8 can be prepared according to Scheme 5. Specifically, a commercially available aniline of formula 4 is reacted with commercially available diphenylcyanocarboimide in a solvent such as acetonitrile at elevated temperature such as the boiling point of the solvent in Step F. A compound of formula 7 is reacted in Step G with amine 1 in a solvent such as acetonitrile at elevated temperature, such as 60 °C, to yield cyanoguanidine 8.

Compounds of formula 9, where X is O or CH<sub>2</sub>, are prepared according to Scheme 6. Specifically, a solution of amine 1 in a solvent such as dichloromethane, 1,2-dichloroethane, N,N-dimethylformamide or the like in the presence of a base such as triethylamine, pyridine, or the like is reacted with a commercially available acid chloride or chloroformate. The reactions are typically exothermic, and caution should be used. Reactions with phenyl acetyl chloride derivatives give amide compounds of formula 9. Reactions with phenyl chloroformate derivatives give carbonate compounds of formula 9.

#### D. Formulation and Administration

The present compounds inhibit the activity of the orexin-2 receptor and therefore are useful as a medicine especially in methods for treating patients suffering from disorders or conditions that are modulated or regulated by the orexin-2 receptor.

The invention features a method for treating a subject with a condition mediated by orexin-2 receptor, said method comprising administering to the subject a therapeutically effective amount of a pharmaceutical composition comprising a compound of the invention. The invention also provides a method for inhibiting orexin-2 receptor activity in a subject, wherein the method comprises administering to the subject a therapeutically effective amount of a pharmaceutical composition comprising a compound of the invention.

The compounds of the present invention may be formulated into various pharmaceutical forms for administration purposes. To prepare these pharmaceutical compositions, an effective amount of a particular compound, in

base or acid addition salt form, as the active ingredient is intimately mixed with a pharmaceutically acceptable carrier.

A carrier may take a wide variety of forms depending on the form of preparation desired for administration. These pharmaceutical compositions are desirably in unitary dosage form suitable, preferably, for oral administration or parenteral injection. For example, in preparing the compositions in oral dosage form, any of the usual pharmaceutical media may be employed. These include water, glycols, oils, alcohols and the like in the case of oral liquid preparations such as suspensions, syrups, elixirs and solutions; or solid carriers such as starches, sugars, kaolin, lubricants, binders, disintegrating agents and the like in the case of powders, pills, capsules and tablets. In view of their ease in administration, tablets and capsules represent the most advantageous oral dosage unit form, in which case solid pharmaceutical carriers are generally employed. For parenteral compositions, the carrier will usually comprise sterile water, at least in large part, though other ingredients, for example, to aid solubility, may be included. Injectable solutions, for example, may be prepared in which the carrier comprises saline solution, glucose solution or a mixture of saline and glucose solution. Injectable suspensions may also be prepared in which case appropriate liquid carriers, suspending agents and the like may be employed. In the compositions suitable for percutaneous administration, the carrier optionally comprises a penetration enhancing agent and/or a suitable wetting agent, optionally combined with suitable additives of any nature in minor proportions, which additives do not cause a significant deleterious effect to the skin. Such additives may facilitate the administration to the skin and/or may be helpful for preparing the desired compositions. These compositions may be administered in various ways, e.g., as a transdermal patch, as a spot-on, as an ointment. Acid addition salts of the compounds of formula (I), due to their increased water solubility over the corresponding base form, are more suitable in the preparation of aqueous compositions.

It is especially advantageous to formulate the aforementioned pharmaceutical compositions in dosage unit form for ease of administration and uniformity of dosage. Dosage unit form as used in the specification herein

refers to physically discrete units suitable as unitary dosages, each unit containing a predetermined quantity of active ingredient calculated to produce the desired therapeutic effect in association with the required pharmaceutical carrier. Examples of such dosage unit forms are tablets (including scored or coated tablets), capsules, pills, powder packets, wafers, injectable solutions or suspensions, teaspoonfuls, tablespoonfuls and the like, and segregated multiples thereof.

Pharmaceutically acceptable acid addition salts include the therapeutically active, non-toxic, acid addition salt forms that the disclosed compounds are able to form. The latter can conveniently be obtained by treating the base form with an appropriate acid. Appropriate acids comprise, for example, inorganic acids such as hydrohalic acids, e.g. hydrochloric or hydrobromic acid; sulfuric; nitric; phosphoric and the like acids; or organic acids such as, for example, acetic, propanoic, hydroxyacetic, lactic, pyruvic, oxalic, malonic, succinic, maleic, fumaric, malic, tartaric, citric, methanesulfonic, ethanesulfonic, benzenesulfonic, *p*-toluenesulfonic, cyclamic, salicylic, *p*-aminosalicylic, palmoic and the like acids. The term addition salt also comprises the solvates that the disclosed compounds, as well as the salts thereof, are able to form. Such solvates are for example hydrates, alcoholates and the like. Conversely the salt form can be converted by treatment with alkali into the free base form.

Stereoisomeric forms defines all the possible isomeric forms that the compounds of formula (I) may possess. Unless otherwise mentioned or indicated, the chemical designation of compounds denotes the mixture of all possible stereochemically isomeric forms, said mixtures containing all diastereomers and enantiomers of the basic molecular structure. More in particular, stereogenic centers may have the (R)- or (S)-configuration; substituents on bivalent cyclic saturated radicals may have either the cis- or trans-configuration. The invention encompasses stereochemically isomeric forms including diastereoisomers, as well as mixtures thereof in any proportion of the disclosed compounds. The disclosed compounds may also exist in their tautomeric forms. Such forms although not explicitly indicated in the above

and following formulae are intended to be included within the scope of the present invention.

Those of skill in the treatment of disorders or conditions mediated by the orexin-2 receptor could easily determine the effective daily amount from the test results presented hereinafter and other information. In general it is contemplated that a therapeutically effective dose would be from 0.001 mg/kg to 10 mg/kg body weight, more preferably from 0.01 mg/kg to 10 mg/kg body weight. It may be appropriate to administer the therapeutically effective dose as two, three, four or more sub-doses at appropriate intervals throughout the day. Said sub-doses may be formulated as unit dosage forms, for example, containing 0.05 mg to 250 mg, and in particular 0.5 to 50 mg of active ingredient per unit dosage form. Examples include 2 mg, 4 mg, 7 mg, 10 mg, 15 mg, 25 mg, and 35 mg dosage forms. Compounds of the invention may also be prepared in time-release or subcutaneous or transdermal patch formulations. Disclosed compound may also be formulated as a spray or other topical or inhalable formulations.

The exact dosage and frequency of administration depends on the particular compound of formula (I) used, the formulation, the particular condition being treated, the severity of the condition being treated, the age, weight and general physical condition of the particular patient as well as other medication the patient may be taking, as is well known to those skilled in the art. Furthermore, it is evident that said effective daily amount may be lowered or increased depending on the response of the treated patient and/or depending on the evaluation of the physician prescribing the compounds of the instant invention. The effective daily amount ranges mentioned herein are therefore only guidelines.

The next section includes detailed information relating to the preparation, characterization, and use of the disclosed compounds.

A white precipitate was observed after stirring for 0.5 to 2 h. The precipitate was collected, rinsed with pentane, and dried under vacuum to yield 280 mg (88%) of the title compound.

##### Orexin Binding Assays

Determination of receptor binding characteristics for compounds described in the invention was accomplished using adherent, cultured recombinant cells and radioiodinated orexin A. Recombinant clones were generated in HEK-293 and CHO-K1 cells, with the latter preferred because they adhere more tightly to the cell culture plate.

Radioiodinated orexin A was prepared by reacting 10  $\mu\text{g}$  orexin A with 1 mCi  $\text{Na}^{125}\text{I}$  and 10  $\mu\text{g}$  chloramine-T in 70  $\mu\text{L}$  of 70 mM potassium phosphate buffer (pH 7.4) for 30 sec at room temperature. The reaction was quenched with 100  $\mu\text{L}$  of 10% w/v bovine serum albumin, then the products were pre-purified using Waters Maxi-Clean C18 cartridges (Alltech, San Jose, CA). The

mobile phase for the reverse phase separations (pre-purification and gradient HPLC) was 0.1% TFA, and the eluent was 0.1% TFA in acetonitrile. After removing the acetonitrile from the Maxi-Clean cartridge eluent by lyophilization, the labeled compound was further purified by gradient HPLC using a Vydac  
5 (Hesperia, CA) analytical C18 HPLC column. A gradient of 2% acetonitrile/min was used and fractions were collected every 0.75 min at a flow rate of 1.5 mL/min. Baseline separation was achieved between the iodinated product and reagents. The specific activity was estimated at 2200 Ci/mmol.

Radioligand binding assays were performed in opaque, white 96-well  
10 tissue culture plates pretreated with poly-D-lysine (Bio-Coat plates, Becton Dickinson, Franklin Lakes, NJ). Cells expressing the orexin receptor were seeded at 30,000 cells/well in 100  $\mu$ L/well Ham's F12 with 10% heat inactivated fetal bovine serum, penicillin/streptomycin and 800 mg/L G418. Four days later the cells had grown to confluence and were ready for the  
15 binding reaction. In preparation for the binding assay, the cell culture medium was aspirated away, and the cells were gently washed with 100  $\mu$ L/well binding buffer (Dulbecco's phosphate buffered saline containing 0.1% w/v bovine serum albumin). The remaining components of the radioligand binding reaction (100,000 cpm  $^{125}$ I-orexin A and test compounds or controls in binding  
20 buffer) were then added to the cells and incubated for 90 to 120 min at room temperature. The assay was terminated by aspirating the liquid from the wells, washing the wells with iced binding buffer, aspirating the wells dry, adding 50  $\mu$ L/well scintillation cocktail (MicroScint 40, Packard Biosciences, Meriden CT), and counting the plate(s) in a Packard TopCount scintillation counter. The  
25 cells expressing the orexin receptor remained attached to the tissue culture plate until the scintillation fluid was added. Data were analyzed using GraphPad Prism software to calculate  $K_i$  values.

### Cell Culture

PFSK-1 cells were obtained from the American Type Culture Collection (CRL-2060; Manassas, VA) and cultured as described by Fults et al. (*J. Neuropathology Exp. Neurology*, 1992, 51(3):272-280). Cells were grown on

10 or 15 cm tissue culture dishes (Corning Inc., Corning, NY) in RPMI medium 1640 containing 25 mM Hepes and L-glutamine (Gibco/Invitrogen, Carlsbad, CA) supplemented with 10% fetal bovine serum (HyClone, Logan, UT), 50 u/mL penicillin G, and 50 u/mL streptomycin sulphate. Cells grown on 10  
5 cm dishes were grown in 10 mL complete medium, and cells grown on 15 cm dishes were grown in 30 mL complete medium. Cells were passed every 3 to 5 days at a 1:5 dilution by aspirating away the medium, adding 2 mL/dish Gibco/Invitrogen Trypsin-EDTA solution, aspirating away the solution, incubating at room temperature 5 min, and dispersing the cells into fresh plates  
10 using fresh complete medium. Cells were then maintained in incubators set to maintain 37 °C and 5% CO<sub>2</sub>.

#### Intracellular Calcium Ion Measurement

15 Agonist binding of orexin receptors elevates the intracellular free calcium ion concentration through the activation of a Gq protein and the opening of voltage-activated plasmalemmal calcium channels (see: A. N. Van Den Pol et al. *J. Neurosci.*, 1998, 18(19):7962-7971). This effect was monitored using the fluorescent Ca<sup>++</sup> indicator Fluo-3 AM (TefLabs, Austin, TX)  
20 and the Molecular Devices (Sunnyvale, CA) FLIPR instrument.

PFSK-1 cells were removed from confluent tissue culture dishes with trypsin-EDTA as described above and plated in 96-well Packard Viewplates (Meriden, CT) at 50,000 cells/well in 100 µL/well complete medium. The next day the cells, which adhered to the Viewplates and grew to confluency, were  
25 loaded with the fluorescent dye. For each Viewplate 20 µL of 2.3 µM Fluo-3 AM was mixed with 20 µL 20% F-127 detergent (Molecular Probes, Eugene, OR) and that mixture was mixed into 10 mL Gibco/Invitrogen D-MEM:F12. After removing the complete growth medium from the Viewplate, 100 µL of the Fluo-3 AM solution was added to each well. The plate was incubated at room  
30 temperature for 60 min or at 37 °C for 30 min. Test compounds were added to the wells in an isotonic, pH-neutral vehicle, such as Dulbecco's phosphate-buffered saline, and changes in intracellular calcium concentrations were measured using the FLIPR instrument.

For screening purposes compounds were tested at a single dose (10  $\mu$ M) to determine the % inhibition of intracellular  $\text{Ca}^{++}$  signalling compared to a 100 nM orexin agonist stimulus. The compounds were delivered to the test wells, and the compounds and the cells were incubated to allow binding.

- 5 Then the orexin agonist stimulus was added to the test wells. The control column for the antagonist screen included positive and negative controls to indicate the fluorescence of a full agonist response and the baseline.

- Antagonism was analyzed by calculating  $K_B$  and  $pK_B$  values for compounds found to inhibit increases in intracellular  $\text{Ca}^{++}$  concentrations of PFSK-1 cells. This was accomplished by determining the  $EC_{50}$  of orexin B and comparing the  $IC_{50}$  values determined from dilutions of antagonist compound(s), all on a single 96-well Viewplate of PFSK-1 cells loaded with Fluo-3 AM. In this case all of the wells except those used to determine the agonist's  $EC_{50}$  were given the same concentration of the orexin agonist (100 nM). The  $K_B$  is then determined after Y.-C. Cheng and W.H. Prusoff (*Biochem. Pharmacol.*, 1973, 22(23):3099-3108) using the formula below:

$$K_B = IC_{50} / (1 + (\{\text{agonist}\} / EC_{50}))$$

- 20 The table below shows  $pK_B$  values for some of the most preferred compounds.  $pK_B$  values for other compounds may be different. The range of  $pK_B$  values of compounds within the invention that were tested to date was between <5 and 8.3. Based on the assay method, values below 5 were not measurable. Higher values, such as 7 or 8 or more, are generally preferred.

4	8.3
5	7.6
12	8.2
